

# Workshop Planning River Monitoring Plan

## **Session Content:**

Identification of the details of goal and scope of work for conducting PCB data collection to define the current state of the river and identifiable contributing sources.

## **Session Outcomes:**

### General

Where, when, and how should PCB samples be taken and what other appropriate data on the river should be collected to define the current state?

Where, when, and how should PCB samples be taken at point sources?

### Specific

At what specific locations should river water samples be collected? What companion data should also be collected?

At what times of the year should samples be collected in order to understand specific conditions in the river? How many sampling events should take place during each specific condition?

How many sampling events should take place at point sources for each river sampling event?

How should each type of sample (river and point sources) be collected and analyzed? What protocols are needed for sampling and analysis?
