

Workshop Planning Potential Source Identification Plan

Session Content:

Identification of the details of goal and scope of work for identifying potential “true” PCB sources in support of the river monitoring plan.

Session Outcomes:

General

Based on the design of the river monitoring plan, what is the potential “true” source inventory in each river segment? What other appropriate data on “upland” sources should be collected to define the current state?

Specific

What specific types, and if possible the volume, of “true” sources are present in each river segment?

What level of aerial deposition exists in each river segment and what is it relative to regional background? Over what duration, frequency, and periods should samples be collected? How should samples be collected and analyzed?
