

SRRTTF Database Update and Design for GIS ArcOnline Map – Scope of Work

The purpose of this project is to allow for the map projection of all past and future sites and results added to the SRRTTF database. The contracted entity will provide a related location table within the access database that includes lat/long within the 83HARN datum. Any result and site provided in the database will have a related lat/long within the location table. Long-term management will include a location table update whenever data with a location component is added to the database.

Tasks may include:

- Contacting entities when appropriate to gather lat/long and datum information.
- Creation or modification of the existing location table in the SRRTTF database.
